WEEK-END PRE-PROJECT PRESENTATION DATA SHEET

Domain-wise project calibration / evaluation framework. This helps evaluate whether a student **actually understands the project they built**.

For **Data Analytics, MERN Full Stack, and AI-ML projects**.

STUDENT NAME: Aditya Patil

DOMAIN NAME: Data Analytics

PROJECT NAME: Fitness Tracker Dashboard

1. Data Analytics Project Calibration Points

S. No.	Calibration Point	What Evaluator Checks	Example	Student Remark
1	Problem Statement	What business or data problem is being solved?	Sales performance analysis	The project analyzes fitness tracker data to understand user activity patterns, calorie burn, sleep behavior, and heart rate trends to generate health insights.
2	Data Source	Where the dataset came from	Kaggle, company database, API	Dataset collected from Kaggle fitness tracker datasets containing steps, calories, heart rate, and sleep information.
3	Data Size & Structure	Rows, columns, type of data	50k rows, 12 columns	457 rows, 6 columns
4	Data Cleaning	Handling null values, duplicates, outliers	Missing values replaced	Removed duplicate entries, handled missing values, standardized column names, and checked for inconsistent records.
5	Data Transformation	Feature engineering, normalization	Created revenue column	Created calculated metrics like average calories burned, activity level categories, and merged multiple datasets using User ID.
6	Exploratory Data Analysis (EDA)	Patterns, correlations identified	Region vs Sales trend	Identified relationships between daily steps and calories burned, sleep hours and activity levels, and

S. No.	Calibration Point	What Evaluator Checks	Example	Student Remark
				heart rate trends during physical activity.
7	Tools Used	Why those tools were selected	Python, SQL, Power BI	Python was used for data cleaning and analysis, Pandas and NumPy for processing, Matplotlib and Seaborn for visualization, and Google Colab for execution.
8	Visualization	Quality of dashboards/charts	Interactive Power BI dashboard	Created bar charts, scatter plots, line graphs, and heatmaps to visually represent activity trends and user behavior patterns.
9	Insights Generated	Key insights from data	Q4 sales drop in north region	Users with higher daily steps generally burned more calories. Sleep hours showed a slight negative correlation with calorie burn. Some users maintained consistently high activity levels.
10	Business Impact	How insights help business	Inventory optimization	The insights can help fitness companies improve personalized health recommendations and user engagement strategies in fitness tracking apps.
11	Automation	Any automation done	Scheduled data refresh	Automated data preprocessing and visualization generation using Python scripts in Google Colab.
12	Limitations	Dataset limitations	Incomplete historical data	Dataset had limited users and no real-time tracking data. Some records contained missing sleep or heart rate values.
13	Future Scope	Improvements possible	Real-time analytics	Future improvements include adding real-time data streaming, AI-based health prediction models, and interactive dashboards using Power BI or Tableau.

Universal Questions to Check if the Candidate Really Built the Project

Question	Purpose	Student Remark
Why did you choose this problem?	Checks understanding of problem	I chose this project because fitness and health analytics are highly relevant today, and I wanted to understand how data analysis can generate meaningful health insights from wearable devices.

CONTACT DETAILS: +91-120-400-1768, +91-7303831260, +91-9315504902

Question	Purpose	Student Remark
What challenges did you face?	Checks real development experience	The major challenges were handling missing values, merging multiple datasets correctly, and identifying meaningful correlations between activity and health metrics.
What would you improve if given more time?	Checks depth of thinking	I would create a real-time dashboard, include machine learning prediction models, and improve the UI/UX of the visualization dashboard.
What alternative technologies could be used?	Checks technical maturity	Instead of Python and Colab, tools like Power BI, Tableau, Apache Spark, or SQL-based analytics platforms could also be used.
How would you scale this to 1 million users?	Checks system design thinking	I would use cloud-based storage, distributed data processing tools like Spark, scalable databases, and automated ETL pipelines to efficiently process large-scale fitness data.
